ABSTRACT

This thesis documents the design, development, and implementation of a sample multimedia instructional program for the Systems Management Department of NPS. The program is designed as a demonstration of potential application of multimedia technology in instruction in the hope that it would serve as the catalyst for stimulating further exploration of multimedia use at NPS. It was constructed with Asymetrix's Multimedia Toolbook authoring system. The program illustrates use of text, graphics, animation, sound, and photo image in an institutional setting. Material for the demo centers around the discipline areas of Economics, Financial Management, General Management, and Information Technology Management.

I. INTRODUCTION

This thesis is a study of multimedia desktop computer technology and its application to graduate level management education in the Systems Management Department at the Naval Postgraduate School (NPS). Chapter I illustrates multimedia applications at other institutions of higher education. Chapter II provides a description of multimedia technology. Chapter III discusses multimedia as an effective pedagogical tool. Chapter IV describes the design and development issues involved with implementation of a multimedia program application for the Systems Management Department at NPS. The multimedia program focuses on four discipline areas in the Systems Management Department: Economics, Financial Management, General Management, and Information Technology Management. Chapter V includes conclusions and recommendations.

A. MULTIMEDIA APPLICATIONS IN HIGHER EDUCATION

In the last few years, more and more institutions are turning to multimedia as a vehicle for improving learning. As opposed to the traditional textbook and chalkboard instructional format, multimedia incorporates two or more media such as, text, sound, graphics, and full-motion video for instruction, typically within a desktop computer system. Faculty throughout the country are experimenting with multimedia technology in numerous disciplines such as medicine, biology, and chemistry. However, its application in the management discipline seems to lag behind and is just beginning to attract the attention of management educators. This section discusses a few such applications.

At Pennsylvania State University, Professor Thomas G. Fox designed and developed interactive, computer-based material for his Introductory Microeconomics Analysis and Policy class. The material is projected on a screen for the entire class to easily view. His presentation incorporates dynamic graphical models full of color, text and animation. This enables Professor Fox to more effectively teach than his previous attempts using the

traditional chalkboard. He can vividly demonstrate movement of supply and demand curves to ensure students clearly understand these concepts. Use of this technology to enhance his lectures have been more successful than he imagined. Student feedback indicate an overwhelmingly positive response to the presentation. In fact, this presentation earned him first place in the business category of Zenith Data Systems' 1992 Masters of Innovation IV competition.

At the Massachusetts Institute of Technology, a multimedia project called "Hypercase" was developed. This project allows management students to interact with video excerpts during case studies, assisting them in decision-making processes. Videodisc playback allow students to review verbal and nonverbal cues essential to the decision-making process.

A Columbia University project involves an interactive self-paced tutorial for dental students. It allows students to learn correct angular placement of teeth and provides remedial practice. Results of this system indicate considerable student performance improvement compared to traditional methods of training.

Since 1991, the Ronald McNair School in Queens, NY, has been using 30 networked multimedia computers with educational software from Jostens Learning Corp. They use the computers to teach mathematics and grammar. The programs include graphics, music and narration. They also use the computer to administer unit tests to the students. Reports from teachers indicate that students are more focused when using the computers verses traditional methods of classroom instruction. (Eng, 1994)

James Madison University (JMU) of Harrisonburg Virginia, has a classroom called "The 21st Century Lecture Classroom." Seating 104 students, it has the capability for multimedia lectures *and* features student interaction through use of automated response keypads at each seat. *With* interaction, the multimedia approach helps students hold and focus *their* attention. The room can provide information using text, graphics, audio, photo images and full-motion video. Professor Harris has obtained interesting results where he was able to explain and illustrate concepts in enough different ways to insure improved

student learning. In a Fall 1992 survey of JMU Psychology students, 90% said multimedia was better than traditional lecture methods and 85% said the 21st Century Lecture Classroom was better than other lecture classrooms. (Harris, 1993)

Bakersfield College in California uses computer and multimedia technology for instruction extensively. Results of equipment configurations at Bakersfield has been a tremendous growth in faculty's use of multimedia for teaching. Most of the faculty who tried the new methods never returned to the traditional methods of teaching. Results of the multimedia presentations has been a high degree of positive response among the students.

At the University of Delaware, the Instructional Technology Center supports the faculty by providing them multimedia training and assistance. The university has constructed a unique facility of six classrooms and one auditorium arranged in a semi-circle around a central "media core" for sharing resources.

The above application examples represent the adoption of multimedia instructional technology in different educational institutions. Besides these unique applications, there are many off-the-shelf educational multimedia application programs available to the public in CD ROM format. However, the majority of them are fascinating only due to the effects they display, not necessarily to their educational value. The challenge to all producers of educational multimedia applications is to develop material that will in fact improve and enhance the learning task. This thesis is an attempt to demonstrate that disciplines such as management that deal with abstract concepts can take advantage of multimedia's multisensory learning.

B. PURPOSE

The purpose of this thesis is to explore the use of multimedia in institutions of higher education and then develop a multimedia program demonstration to illustrate potential applications for the Department of Systems Management at the NPS. Currently multimedia is not used in the classrooms within the Department of Systems Management

at NPS. This demonstration of potential application should be a first step toward faculty's future exploration of the feasibility of using multimedia at NPS.

C. RESEARCH QUESTIONS

The following research questions are the basis for this thesis:

1. How is multimedia technology used in higher education?
2. What hardware and software is required to develop multimedia instruction?
3. How is multimedia used as an effective pedagogical tool?
4. What are some limitations of multimedia?
5. What are some requirements for successful integration of multimedia in higher education?
6. How can the faculty of Systems Management Department transform their instructional material into multimedia format?

D. LIMITATIONS

The scope of this study is limited to exploring potential application of multimedia technology to enhance instructional effectiveness in the area of management education. The use of equipment was limited to Commercial-Off-The-Shelf (COTS) standard personal computer hardware and software available to the Systems Management Department and the demonstration program focuses on the features that can be accommodated by computers with widely available hardware setup. Features such as audio and full motion video are not emphasized due to their special requirements for hardware such as sound card, CD-ROM, optical disk, or large-capacity hard disk.

E. POTENTIAL MILITARY APPLICATIONS

Multimedia has been used extensively by both industry and the military within simulators. The software within simulators is sophisticated enough to simulate realistic conditions. Some of the benefits of multimedia simulated learning include:

- cost effectiveness - simulators are used to enhance military training. Training on highly expensive weapons systems, for example, save time and money, especially in times of budgetary cut-backs.
- safety - simulators allow users to make mistakes without the risk of injury or death that is associated with real world situations.
- standardization - for fundamental training, simulators insure the same standards for all users which plays an important factor in unit readiness.
- realistic training - with the use of graphics, video and sound, military training can be more realistic, thus accomplishing the task of adequate training in less time than traditional training methods.

Multimedia applications for DON/DOD students should incorporate the learning from military training technology and learning from other institutions of higher education across the country. Innovations in delivering higher education using multimedia have these possible benefits:

- Decrease time on-site - multimedia software could be sent to military personnel bound for NPS to complete independently before they are admitted to NPS. There is an expense to pulling military personnel off their jobs for participation in refresher courses at NPS.
- Increase standardization of material - instruction can be standardized so that quality is not instructor dependent.
- Enhance decision making capability - multimedia can simulate real management situations so that students can practice decision making in a risk free environment.

This chapter introduced applications of multimedia in institutions of higher education. Also, the scope of the study is described. The next chapter provides an overview of multimedia hardware and software needed to develop multimedia programs.

II. MULTIMEDIA TECHNOLOGY

A. OVERVIEW

Multimedia can provide a stimulating environment for teaching and learning, making it engaging. It incorporates two or more media within a desktop computer system. Multimedia can be defined as organized access to text (words, and numbers), aural (sound effects, music, and speech), and visual (graphics, video, and animation) elements, all combined into one presentation controlled by a computer. (Lamb, 1992)

Organized access to text is called "Hypertext". Hypertext provides an electronic form of learning which allows users with different backgrounds to pick their own strategy for navigating a multimedia presentation.

What makes multimedia interesting is the use of hypermedia, an extension of hypertext with the use of multiple forms of computer media. Hypermedia refers to the many dimensional connections that are available by use of non-linear navigation within a multimedia presentation. (Perelman, 1992)

The use of hypermedia and hypertext enable viewing multimedia presentations in a non-linear fashion, unlike the sequential page turning of a book. The term Hypernavigation is used to define the movement capabilities of multimedia use. Besides the navigation capabilities, multimedia presentations allow the user to be actively involved with the presentation by providing input.

The development of a multimedia presentation requires developers to use a software application called an "**authoring system**." Through the use of a multimedia authoring system, a developer can create a properly designed, assembled, and applied application for users to take advantage of interactive multimedia.

B. HARDWARE

Industry has categorized the use of multimedia by hardware components of varying capabilities. In order to standardize computer capability for multimedia, the MPC (Multimedia Personal Computer) Marketing Council has used the term "MPC levels" to describe this. Multimedia manufacturers develop their software to operate on minimum standards and often refer to MPC levels. The first level, MPC 1, was published in 1990, and MPC 2 in 1993. Both levels must support Microsoft Windows version 3.0 with Multimedia Extensions or Windows version 3.1. MPC 1 consists of the following components:

- 16MHz 80386SX or compatible microprocessor
- 2 MB of RAM
- VGA-compatible display adapter and color VGA compatible monitor
- 30-MB hard disk
- single-speed CD-ROM drive with a 150 KB-per-second data transfer rate
- 3.5-inch high-density diskette drive
- an eight-bit sound board
- a 101-key keyboard
- a two-button mouse
- standard serial and parallel ports
- a MIDI port and a joystick port

MPC level 2 consists of all the components of MPC 1, with additional capability as follows:

(Spanbauer, 1994)

- 25-MHz 80486SX microprocessor
- 4 MB of RAM
- 65,000-color graphics at 640 by 480 pixels
- 160-MB hard disk
- double speed CD-ROM (300 KB/sec transfer rate, avg seek time of 400 ms)
- 16-bit, 44-kHz MIDI(musical instrument digital interface)-compatible audio board

MPC 3 has not been established yet. However, New Media magazine predicts that it will include MPC 2 capabilities plus a 66-MHz 486 processor, 8 MB of RAM, and 240-MB hard disk. Additionally, it may include a local bus motherboard (VL-Bus or PCI), a local-bus graphic accelerator, and a set of speakers. These different levels reflect the advance of multimedia software capability, which necessitate the use of more powerful hardware for processing. For purposes of operating the NPS demo developed in the thesis, MPC 1 capability is the minimum standard, but MPC 2 is recommended for better response time.

C. MULTIMEDIA FILE FORMATS

Multimedia can be stored on secondary storage computer devices such as hard disks, floppy disks, optical disks, CD-ROMs, video tapes, laser disks, and video tapes. Along with the effects multimedia has to offer is an association of the media types (text, graphics, animation, audio, and video) with common file formats.

Text is usually produced with some type of word processor or text editor. The text font style, point size, attribute, and color can be affected to produced the desired effects on a computer screen. Use of scaleable fonts allow more flexibility in changing fonts without loss of definition. Most application software for Microsoft Windows allow easy cut and paste transfer of text to multimedia authoring systems.

Graphics can be produced by many graphic programs in several proprietary raster or vector formats such as paint, draw, and presentation. They can also be copied from a paper to digital format using a scanner or captured from video sources such as camera. Each graphic format usually has methods of file transfer capability to commonly used file format such as TIF, GIF, JPEG (Joint Photographic Expert Group), BMP, DIB, WMF. Some formats are better at compressing the graphic file size but may also take longer to display than other formats. Choosing the format depends on several factors. Depending on the user required presentation clarity and sharpness of images, various levels of quality can be used. To conserve disk space, instead of using 24-bit color images, one should use 256-color, or 16-color resolution images if detailed gray scale image is not necessary.

Animation is usually produced with an application which specializes in capturing graphic frames for sequential playback, or in programming a sequence of instruction to control objects. Animation can enhance a presentation by allowing objects to move in a specified path or change object characteristics. The standard file formats are FLC, FLI, and MMM.

Audio is produced with the aid of a sound card which is embedded in a computer and a set of speakers. Two common sound file types are WAVE (.WAV) and MIDI (.MID). The quality of sound can be improved by using 16-bits per sample size instead of 8-bit, and using a higher frequency sampling rate such as 44.1 kHz instead of 22.05 or 11.025. The higher the quality, the higher the file size. Sound can be recorded digitally by the sound board to create WAVE files, usually allowing analog (traditional stereo systems and microphones) or digital inputs (latest digital stereo such as CD players). The WAVE files can store the digitized voice and/or music instrumentation, whereas MIDI strictly allows only simulated instrumentation sounds. If human voice is not necessary in a sound, savings in file size can be achieved using the MIDI format instead of the WAV.

Video sources come from various industry standards such as Hi-8, S-VHS, VHS, Betamax, Betacam and are usually recorded with a video camera. A video capture board can be used to avoid the conversion of video tape format to digital format, whereby the

video camera is directly connected to the computer's video board via cables. Another method of displaying video is using video overlay, where the video format is played back on its original form at the time of need and transferred into the presentation without converting to digital format. Video comes in two common file format extensions, one is the AVI (Audio-Video Interleaved), and the other is DVI. Digital video file sizes, in bytes, can be estimated using this formula: (image size X bytes/pixel X frames/sec X seconds of video). As an example, a 320 by 240 pixel image size, at 24-bit color, at 16 frame/sec, for 60 seconds would result in a file size of about 211 MB. Video files are often compressed to reduce disk space consumption. While there is an industry standard for digital compression-decompression (codec) called MPEG (Motion Picture Expert Group), there are several more mature established codec methodologies to choose from such as Motion-JPEG (set by Joint Photographic Experts Group) and DVI (Digital Video Interleaved).

D. MULTIMEDIA AUTHORING SOFTWARE

There are a multitude of software applications such as spreadsheets, word-processors, and graphic presentations, which can develop screens for multimedia use, however, as an authoring system, they often lack the capability for controlling the objects and different media. Authoring systems provide these same features with the additional capability to integrate and control other media within a presentation.

Some of the important features of an authoring system include:

- **script language** - allows the use of a specialized programming language for detailed control of a presentation and its interfaces
- **ability to call external programs** - allows the multimedia presentation to execute programs which are external to itself such as a spreadsheet or graphical application, without exiting the presentation
- **video editing** - allows the developer to work with individual frames of a video clip such as adding, deleting, or modifying individual frames
- **path-based animation** - allows the developer to designate a specified path for the animation to follow when activated

- **support of various video formats** - allows the multimedia presentation to interface with many different types of video formats
- **support of various file formats** - allows the developer to input various different types of file formats such as TIF, GIF, AVI, and MPEG
- **support of various linking standards** - allows the developer to implement linking options between the presentation and other applications (a common one is called OLE-object linking and embedding)
- **MIDI & WAVE editor** - allows the developer to alter (change temp, note, or volume) or compose sound files for use in the presentation
- **synchronization control of objects** - allows the developer to control objects in a presentation by synchronizing them by time

There are many authoring systems to choose from. Appendix A lists examples of packages available which have varying degrees of capability.

E. CONSIDERATIONS FOR DESIGN

When one develops a multimedia presentation, it is imperative that considerations be made of the hardware and software capabilities available before deciding which media to use. As an example, the use of video files take an exuberant amount of disk space, therefore, limited use is recommended if the files are stored on hard disk, otherwise, CD-ROM is the preferred storage media. If storage media is a constraining factor, when instrumentation sounds are desired, it is better to use the MIDI file format instead of the larger WAVE file format. Also, the higher resolution scanned images and complex graphics can consume a sizable chunk of disk space.

Another important factor is knowing the kind of equipment on which the multimedia presentation will be made. If the presentation is developed using a SVGA resolution setting and monitor, the presentation may not display effectively on equipment configured for VGA resolution. That is, the screen may not display the full size or quality picture. Also, certain high resolution images may create system errors if they are not able to be displayed. If sound files are used, the presentation program needs to detect equipment

lacking that capability or it may fail to operate at all. Additionally, even though equipment may be configured with a sound board, the sound drivers may not be properly loaded and/or configured to play sound files. Some authoring systems allow internal function calls to detect and account for such inconsistencies or to inform the users. Therefore, the choice of an authoring software plays an important role in the success or failure of a multimedia development project.

When designing a multimedia presentation there are several roles and responsibilities that are inherent in the process. While multiple roles can be performed by the same individual, in the professional world it is not common practice. Here is a sample of the major roles:

(Asymetrix, 1994)

- Producer
- Writer/Content expert
- Editor/Proofreader
- Interface designer
- Illustrator/Animator
- Audio technician
- Video technician
- Programmer
- Tester

This chapter has offered a description of multimedia hardware and software which is needed to develop a multimedia program. Chapter III will discuss multimedia as an effective pedagogical tool.

III. MULTIMEDIA AS AN EFFECTIVE PEDAGOGICAL TOOL

Effective application of multimedia in education requires an understanding of learning theory and the acquisition of knowledge. This chapter explains a few of the basic elements of learning theory that are most relevant to the use of multimedia in the classroom. Technological features are described that take advantage of the learning process. Limitations of multimedia as a pedagogical tool are discussed and suggestions for overcoming the drawbacks are provided.

A. LEARNING THEORY & MULTIMEDIA TECHNOLOGY

Learning theory informs the understanding of individuals' acquisition and retention of knowledge. While the field of knowledge acquisition is widespread and continues to evolve, this chapter addresses three relevant aspects of learning theory: levels of learning, multisensory presentation and interactive learning.

1. Levels of Learning

The model shown in Figure 1 depicts the **Continuum of Knowledge Acquisition**. (Jonassen and Grabinger, 1993) These levels explain four different types of learning that occur. As a generalization, individuals usually proceed through these levels in successive stages. (Watson, 1979) When a learner has little prior knowledge or experience on a topic being learned, the user is said to be engaged in **Introductory Learning**. The next phase of learning is called "**Advanced Knowledge Acquisition**", where the user builds upon information gained during Introductory Learning. The final phase of learning is called "**Expertise Learning**". Here the user combines previous knowledge structures and experiences to assimilate new understand.

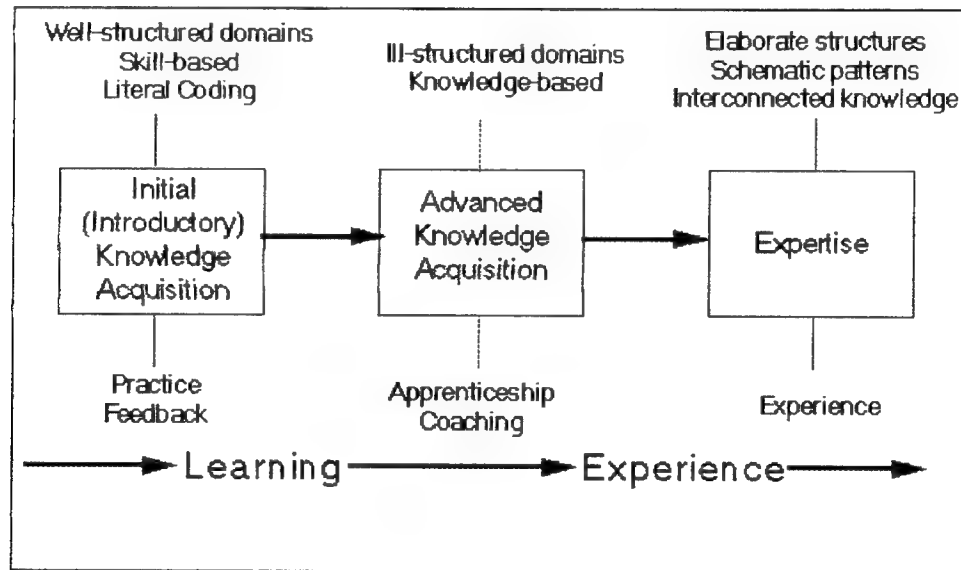

Figure 1. Continuum of Knowledge Acquisition

This continuum of knowledge acquisition can be used to inform the design of pedagogical tools such as multimedia. For instance, students at the introductory level generally have little or no prior knowledge about a particular topic. Effective design of introductory instruction requires an analysis of learners at this stage and then a design to meet the needs for that level of learning.

2. Learning Processes

Hypertext can be used to support these different learning processes: Accretion, Restructuring, and Tuning. Figure 2 depicts a Continuum of Hypertext for learning. (Jonassen and Grabinger, 1993). It describes four classes of learning applications of hypertext. Accretion, which occurs in the first two classes, involves acquiring information to fill existing memory schematas. As the accretion occurs, learners begin to restructure their schematas or develop new ones, class three and four. This restructuring allows learners to interpret or access their knowledge in new ways. Through use of new knowledge structures, a tuning process occurs which enhance their use in new situations.

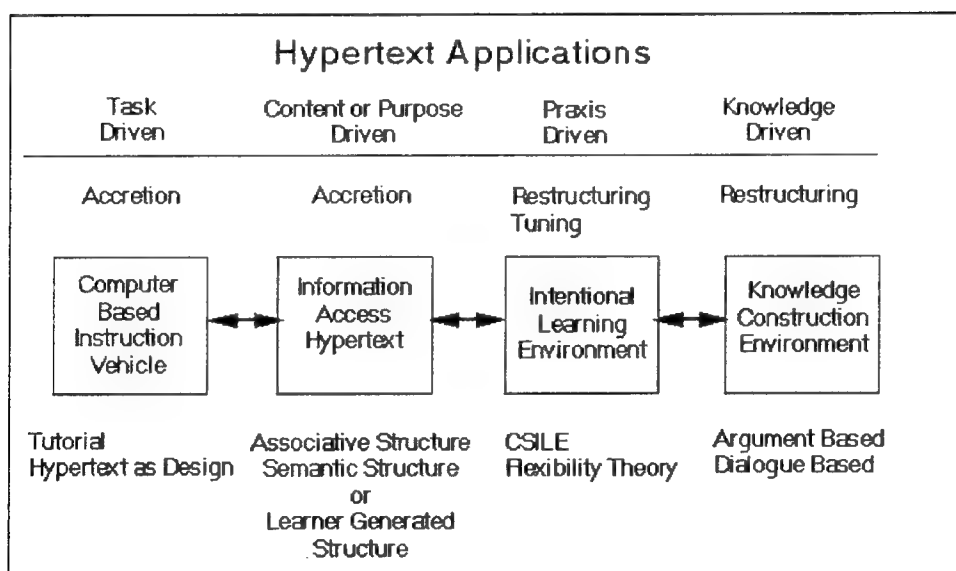

Figure 2. Continuum of Hypertext

The first class describes applications such as Computer Based Instruction (CBI), where the learner uses it as an information retrieval system. This type of applications has other names: Computer Based Training (CBT) or Computer Aided Instruction (CAI).

The second class describes applications of information Access Hypertext, where learners are required to actively engage in materials and construct personal knowledge from them.

Class three, Intentional Learning Environment, engage learners deeper, requiring them to control attributes of their learning. At this class the learner must have a clear learning goal.

The fourth class, Knowledge Construction Environment, enables the learner to interact with the learning task in a participative capacity. When used with hypertext knowledge bases this is called Collaborative Knowledge Construction. It was determined that meaningful learning will result only if it supports active knowledge construction by the learners in order to fulfill a meaningful purpose.

3. Multisensory Learning

There is reality to the cliché, "A picture is worth a thousand words." We've all heard and experienced the realities of viewing a picture which reveals more than words could adequately depict. In fact, it is said that as much as 60 percent of the brain may be involved in seeing. (Perelman, 1992) Therefore, the ability to present information visually becomes an asset in knowledge acquisition. Numerous studies (Bationo, 1991; Nasser and McEwen, 1976) have indicated that use of multiple sensory channels is more effective than using each channel alone.

4. Learning As An Active Process

Learning is more penetrating and long lasting when individuals are actually involved. A number of research studies which have investigated the relative effectiveness of various instructional methods provide further evidence that active learning is more impactful than passive learning. (Watson, 1979)

In particular, Miller (1990), has shown that technologies involving user participation, through use of multimedia materials, provide benefits to the task of learning. These interactive technologies reduce the learning time since learners actively participate while receiving instant feedback. The use of interactive systems increase the information retention rate. It also provides the learner with greater control of their learning process since they can vary the speed and intensity of material coverage. (Miller, 1990)

A highly interactive form of multimedia is called "Collaborative knowledge construction" which involves a group of students who can contribute their interpretations and perspectives. Collaborative hypertext is designed with the intention to force learners to interrelate content within domain and to take personal positions to the issues at hand. (Jonassen and Grabinger, 1993)

5. Advantages of Multimedia Instruction

Learning through use of computer desktop multimedia technology offers advantages over conventional learning methods. Besides the usual textual formats available in books, learning by multiple forms of computerized media allows the use of more of the senses. As a result, retention is higher.

The evolution of computer technology has introduced many capabilities including high resolution full-motion video, high-fidelity sound, photo quality scanned images, graphics, and animation. Now with the use of sophisticated authoring programs, there is the ability to interact with the computer using these capabilities. Use of these capabilities has unleashed a potential explosion of learning techniques for the educational institution.

6. Classroom Arrangements

In fulfilling the different learning requirements by use of multimedia, Lamb (1992) identified five levels of classroom arrangements. The levels range in magnitude by order of technology sophistication. Minimal technology is contained in the first two levels, the seminar room and the traditional classroom. Level three, the media enhanced classroom, contains a permanent overhead projection system and a videotape playback system. Level four, the technology classroom, contains all the video equipment plus a podium which controls a multimedia presentation station. It contains a computer, video-data projector, videodisk, CD-ROM players, desktop video camera system and other resources. At level five, the technology enhanced learning environment, networked workstations are added. As the classroom levels increase, there is less traditional teaching by the teacher. The teacher acts more like a facilitator to assist and inspire the learner in achieving the learning task at hand. The teacher will spend more time authoring multimedia material. The higher

level classrooms also involve interaction by the user which allows the learner to create their own learning environment.

B. LIMITATIONS/BARRIERS TO IMPLEMENTING MULTIMEDIA

Although there are excellent uses for multimedia in a learning environment, it is not widely used in *higher* education for various reasons which are elaborated below. A brief look at the evolution of technology in higher education *and* some of the current realities of academia sheds light on some of the problems.

Higher education has seen three different revolutions in the past 20 years which were to change the methodology of education:

- Films & video tapes
- Microcomputer
- Multimedia

Even though millions were spent on films and video tapes and billions spent on microcomputers, none of these three revolutions proliferated our educational systems. Although multimedia with computer-based instruction has been around for many years, it has failed to gain its roots into higher education for the following reasons:

(Solomon, 1994)

- There are no incentives set-up for faculty members to develop multimedia materials, unlike incentives for writing a successful textbook which can net \$50,000.
- There is not enough credit given towards tenure and promotion for multimedia development.
- The typical faculty member is not sufficiently trained in graphics, computer programming, directing, producing, animation, and other areas necessary for effective multimedia.
- In many cases it requires institutions to invest in rather expensive equipment. Departments have not been convinced that multimedia will reduce the cost of education, thus they spend funds on other projects.

- Multimedia development is time consuming.
- There are still too many different equipment configurations and techniques for this field.

From economics' point of view, lack of the essential standards also discourages professors, publishers, and others involved with distribution of educational multimedia. With technology changing every 18 months or sooner, many are skeptical to make large investments that may quickly become obsolete.

C. REQUIREMENTS FOR SUCCESSFUL INTEGRATION OF MULTIMEDIA

Despite the institutional constraints, economic barriers and technological changes, there are many successful cases of multimedia instruction application in higher education institutions, and the number is rapidly increasing.

The literature on the development of multimedia in the classroom offers many "lessons learned". These lessons include the requirements for administrative support and specific technical suggestions for designing effective multimedia instruction.

1. Administrative Support

A high degree of support must come from top management for multimedia to be successful. When leadership supports a project, it is easier for faculty to become innovative in developing multimedia assisted instruction.

For successful implementation of multimedia instruction, administrators can support faculty in these ways:

- Incentives - sabbatical leaves and consideration of multimedia curricula development in tenure and promotion.
- Technical Support Staff - full-time committed technical support staff with multimedia technical development teams for both hardware and software.
- Formalized Training - scheduled formal training in multimedia development skills and techniques such as authoring system, peripheral, and use of full-motion video.
- Multimedia Equipment - availability of dedicated multimedia labs and classrooms for both development and presentation.

2. Development Techniques

It is not enough to have support from management in implementing multimedia training. Effective multimedia development is critical in attracting and maintaining learner attention and participation.

Professor Fred Hofstetter of the University of Delaware teaches using multimedia and offers the following principles for developing presentations:

(Hofstetter, 1993)

- flow any text onto the screen in your favorite color, font and style
- link text to other text
- use graphic art, images or video
- create hot spots which trigger other objects
- treat text, pictures, videos, and animation as objects for linking
- link any object with other objects to include sound files
- use easy to understand metaphors
- adopt standards in order to maximize use of your investment

When multimedia presentations are developed properly, students will get actively involved with learning by interacting with hypertext presentations. Passive learning, where learners merely observe faculty, is not as effective as active learning.

A well designed multimedia presentation allows learners to control the pace and activity they are engaged in, as well as the purpose and outcomes of their learning. (Jonassen and Grabinger, 1993) Prior to use of a presentation designed for a single learner, it is important that the learner master fundamentals of the topic at hand. In a classroom environment, where the presentation may be designed with more rigid navigational options, the professor has the responsibility to control the navigational path of the presentation.

D. DESIGNING A DEMO FOR NPS SYSTEMS MANAGEMENT DEPARTMENT FACULTY

To spread the interest of multimedia in higher education among the faculty at NPS, the author developed a multimedia presentation program using an authoring system for demonstration purposes. In developing the demo, the author considered the various levels of multimedia learning processes. For example: the **Introductory Knowledge Acquisition** phase multimedia presentation contains well-structured domains. The learner has little prior knowledge or experience in the topic. For these learners, the presentation must be guided and use of learner controlled navigational capability will have to be somewhat constrained. Whereas, learners who have mastered basic fundamentals, such as those of the **Advanced Knowledge Acquisition** phase, can use that knowledge and multimedia navigation to create a learning environment, such as in full-scale simulators.

The primary audience of this demo is the faculty who do not currently use multimedia presentations. Therefore, material was prepared for the **Introductory Knowledge Acquisition** phase. Faculty would view the demo as a computer based instruction vehicle. The navigational capability is limited, however, there are selectable options through use of buttons and hot words.

To illustrate some material of the **Advanced Knowledge Acquisition** phase, the demo provides the capability for learner interactivity within the Financial Management portion of the demo. As an example, results of the accounting statements is affected by user input to the simulated accounting cycle.

The demo is composed of multimedia illustrations from four discipline areas of **Economics, Financial Management, General Management, and Information Technology Management.**

IV. ILLUSTRATIVE EXAMPLES OF MULTIMEDIA INSTRUCTIONAL MATERIAL IN SYSTEMS MANAGEMENT

A. DEVELOPMENT

An authoring system is a computer software application which is used to develop a multimedia computer presentation. To develop a multimedia presentation program suitable for demonstrating the capabilities of multimedia instruction for this thesis, a capable authoring system was needed. For the author's purposes, the kind of application itself was not as critical as the inherent features needed for producing the demonstration program. An authoring system was required with the capability of including text, illustration, graphics, animation, photo image, audio and video features.

To fulfill this requirement, an authoring system from Asymetrix Corporation, Multimedia Toolbook version 3.0, was selected. It was found to be competitive with other major commercially available authoring systems. Compared to others, it does require more programming skills by the developer, however it allows more control of the presentation. An advantage of this system is its capability for exporting finished presentations via a runtime program that can be distributed to end users with the presentation. This feature eliminates the need for each end-user to own the authoring system software. While the initial intent of this demo is to make it available to the faculty and staff in the Systems Management Department, the potential exists for interdepartmental or inter-university export.

Along with the software is the need for appropriate hardware. Asymetrix recommends the following minimum configuration for the authoring system: 80386 processor, six MB of RAM, 15-30 MB hard drive, CD-ROM drive, a monitor and graphics card capable of VGA or Super VGA resolution or better, and a mouse or pointing device. For audio and full-motion video capability, the system should be equipped with a sound card, two external speakers, and a video capture card. The video

capture card is not necessary for systems requiring playback mode only. The playback systems do not require a CD-ROM drive. Hardware was available for the author's use in the Systems Management multimedia lab which consisted of the following components:

- 80486 CPU 66MHz CPU
- 8 MBytes RAM
- MS-DOS version 6.2
- 335 MB hard disk
- double speed CD-ROM
- 3.5 inch high density floppy drive
- 16 bit sound board with speakers
- video capture board
- SVGA monitor and SVGA video board

In creating the demo program, the author followed a seven-step process to carefully design, develop and implement a demonstration program:

(Howles, 1993)

1. Select Potential Lessons

Selecting potential lessons required the author to first decide on the academic discipline areas upon which to base the content of the demo effort. In meeting with the author's thesis advisors, it was determined that the disciplines within the Systems Management Department which could best demonstrate multimedia features were: Economics, Financial Management, General Management, and Information Technology Management (ITM).

Professors knowledgeable in the above discipline areas were contacted by the author. An initial meeting with the professors was held to inform them of this thesis and to demonstrate a brief example of what multimedia could offer in an educational setting.

One-on-one follow-on meetings with the professors resulted in selection of potential course material for content of the demo.

Reference material that was recommended by the professor in each discipline area follows:

Economics (Gates, 1994)

Financial Management (Moses, 1994)

General Management (Thomas, 1977) (Kilmann and Thomas, 1974)

Information Management Technology (Stallings, 1994)

2. Describe Specific Learning Objectives

The author captured the learning objectives of each of the lessons which he planned to convert into electronic format and incorporate into the demo. Each objective required varying multimedia techniques. For example, the Financial Management portion required interactive participation with animation to understand the accounting cycle.

3. Create a Scope and Sequence Outline

The knowledge each professor had of multimedia varied, therefore, the author supplemented their knowledge of multimedia technology in order to design a scope and outline for the lesson content with intended effects. For example, the General Management portion of the demo required careful event timing sequencing to produce the desired effects.

4. Identify Specific Graphic or Audio Material to be Used

In planning the demo, the author and professor of each discipline area choose appropriate lesson material training aids to be used in the automated presentation. Use of graphic and audio material was identified for each lesson as needed by the professors. Video was discussed as an option. However, due to disk space consumption and playback requirements, use of video for the discipline areas was avoided.

5. Explore Multimedia Techniques

In order to create the effects required by the professors, this step required heavy research in Toolbook's programming reference manual. Since each lesson was diverse in

its intended objective, the author planned a variety of different multimedia techniques. Some ideas for techniques were obtained through analysis of Toolbook's sample programs. While others were provided by the professors. For example, the Financial Management discipline required the use of user interaction to explain the accounting cycle.

6. Develop a Storyboard

With assistance from the professors, the author planned and developed simplified storyboards sketched on plain paper to simulate screens of the computer presentation. In some cases, multiple storyboard pages represented a single computer screen due to the complexity of animation involved. In planning the screens, some basic factors affecting computer screen appearance were kept in mind:

- restrict text charts to 7 or 8 bullet points to prevent clutter
- use fonts that are large enough and clear enough to view
- use coordinating colors that attract attention
- use graphics to enhance, not distract
- use sound for appropriate effects but not in excess
- provide logical progression of movement from big picture to fine detail
- provide enough information to support major concepts

7. Produce the Lesson Using the Authoring Software

For ease of program transportability, the overall demo file size was intentionally held down to use of one to three high density three and a half inch format floppy disks. Use of video, graphic files, and sound files was scrutinized to achieve this goal.

Use of the authoring system required a substantial knowledge of Asymetrix Corporation's Open Script language. There is a steep initial learning curve which must be overcome before effective production can be accomplished. While there exists a method for automatically generating Open Script language by use of dialogue screens, its usefulness was found to be very limited. This step required the most diligence and

concentration since it involved learning the capabilities and limitations of Toolbook continuously. Careful planning was necessary to synchronize the actions of a typical animation screen.

B. IMPLEMENTATION

After the screens were developed, each of the professors viewed their portion of the demo to provide constructive feedback. Their recommended changes were then applied to the screens. This process continued until they were satisfied with the demo. The same type of review process was performed with the thesis advisors for additional input and refinement.

The next step involved testing the software to ensure it was free of software errors. The author did this by performing an exhaustive execution of every possible option available in the demo.

The last step involved creating a set of installation disks. Toolbook has a utility designed to combine all necessary files onto disk for ease of installation on a computer. By loading the runtime files onto disk, users are able to operate the demo without the need for the entire Toolbook software package.

Appendix B describes the demo in detail and the procedures to use the program. Appendix C lists the detailed Open Script language source of the program.

V. CONCLUSIONS

A. LESSONS LEARNED

Based on development of the demonstrative multimedia program for the Systems Management Department, these were the lessons learned:

1. Choosing Appropriate Multimedia Types For Instructional Material

Effective instruction using multimedia depends on matching the various types of multimedia (text, graphics, photo image, animation, sound, and video) with the instructional material.

Text should be used sparingly. It can be used to explain terminology, describe simple processes, or amplify conceptual ideas. For example, the General Management portion of the demo contained many text screens defining management terminology.

Graphics can provide pictorial representations of complex or detailed concepts. Graphics can be used to show relationships and representations. For example in the Economics portion of the demo, is represent the classical interaction between supply and demand curves.

Photo images can provide the effect of simulating reality as a static rendition. For example, in the ITM portion of the demo, a bitmap photo image was used as a backdrop to simulate communications within a city. This provided the user with familiarity to real life experiences.

Animation provides dynamic movement of graphics, simulating realistic processes in action. For example, in the ITM portion of the demo, animation was used to visually depict the computer data traveling through various hardware components during data communications.

Sound can provide enhancements to graphics, animation, text, and photo image as voice, music or for special effects. Sound is an inherited component of video providing

accompaniment to the visual component of video. Sound was used in the Main Menu of the demo as background music as well as in the Economics portion of the demo as special effects.

Video can provide real-time playback of full-motion clips which is especially useful in demonstrating realistic sequential situations and actions. Due to the need to conserve hard disk space, video was used sparingly in the demo only to illustrate a short clip.

2. Designing Multimedia Screens

The following techniques of screen development were found most effective:

a. Limit Each Screen To One Main Idea

Too many points clutters the screen, creates confusion, and distracts from learning.

b. Limit Text Font Types and Sizes

Restricting text fonts and sizes enhance user readability and appearance of information. Caution must be used in selecting the font. For example, italics or script fonts are usually hard to read on the screen.

c. Use Color Appropriately

Coordinating colors are more appealing and do not distract the learner from the purpose of the screen. For example, use of a color for highlighting key words should blend in with the screen and not distract users from the purpose of the screen. Also, colors should coordinate well together to prevent distraction.

d. Standardize Graphical User Interface

Strategically place control objects for ease of location and use. For example, the placement of the quit button should always be in the same area, away from other functional buttons. Also, use of standard object types ensure learners understand their purpose with little or no instruction.

e. Provide Ample Explanations of Terminology

Users should have access to additional resources, such as hypertext or hot words, if terminology requires clarification. For example, in the ITM portion of the demo,

explanations were given for data communications terminology, in the form of hidden text, which is unfamiliar to the layman.

f. Provide Enough Directions For Operation of the Demo

Users should be able to understand how to manipulate the graphical user interface to view the demo. For example, explain the functionality of object buttons by use of labels or hot words.

3. Interactions With Content Experts

While interacting with the professors, their most difficult task was conceptualizing the transfer of their material into a multimedia demo. The goal was to get professors in the producer role, similar to film making, so that they could influence the demo's intended multimedia effects. One professor in the General Management discipline was able to document his classroom chalkboard teaching methods for inclusion in the multimedia demo screens.

Implementation of the demo required several iterations of development and review with the professors. It was important to receive feedback from the content experts regarding their portion of the demo. This provided assurance of accurately transferring their instructional material into the desired multimedia effects. In fact, as the professors incrementally tested the demo for accuracy, logic, and clarity, they generated valuable feedback for improvements.

B. SUGGESTIONS FOR IMPLEMENTING MULTIMEDIA AT NPS

Review of literature provides several suggestions for implementing multimedia at NPS. The faculty should have more exposure to the potentials of multimedia through use of the multimedia demo resulting from this thesis, as well as external sources.

Next, upper management must be convinced for support of concept and funding. Once upper management approves the concept, a dedicated lab should be arranged for the faculty to develop their presentations. For classroom presentation, use of multimedia equipped computers can be shared on a cart, until such time classrooms can be upgraded with the needed computer and projection systems.

As a first step towards development of multimedia presentations, there should be a transformation of traditional teaching methods to multimedia by converting all paper and/or transparency material into static electronic presentations. The electronic form of instructional material can then be expanded to incorporate multimedia features when appropriate.

If a determination is made for the faculty at NPS to develop their own multimedia presentations, then an authoring system which requires little or no programming will be required. Toolbook is too programming-oriented and has more capability than needed by faculty. It is preferred that the system have a graphical user interface for ease of operation (point and click). Otherwise, faculty will probably be intimidated by the time intense process and fail to adopt it.

It is imperative that the faculty developed presentations contain quality up-to-date material. Otherwise, the students will not gain from multimedia presentations. In fact, it may become a distraction to learning. Faculty and upper management will have to rely on student feedback to evaluate the effectiveness of the multimedia presentations.

If it is decided that faculty not develop their presentation, then a support staff will need to be established. A dedicated technical staff would have the advantage of having the time to acquire the needed skill and apply that skill to all faculty who need the assistance. The support staff may provide multimedia courses for the faculty to become proficient in the skills necessary for multimedia development, such as the process required in developing a multimedia presentation.

C. RECOMMENDATIONS FOR FURTHER DEVELOPMENTS

Potential projects to further explore the use of multimedia at NPS:

- research easy to use authoring systems for use in academia
- develop a standalone tutorial for current students who require remedial training outside of normal classroom instruction

- develop a standalone tutorial for use to replace NPS's refresher courses for new students. This would reduce the amount of time the military student would normally spend in refresher training by three to six months, thereby reducing educational costs to the military and returning the service member to duty sooner.
- develop multimedia presentation for one course having multiple classes, then conduct study group analysis of those using the multimedia presentation verses those who use traditional methods of instruction.

APPENDIX B: USER MANUAL

This User Manual describes the computer screens generated by the multimedia demo. All screens have been captured as figures and are defined below. Navigational buttons appear as a hand pointing finger  or as a button with words on it . Other navigational buttons are the previous page  and next page . Hot words are indicated as red words and are activated when the user places a pointing device, such as a mouse or trackball, over it. The hot words are de-activated when the pointing device is removed from the hot word.

A. INTRODUCTION

1. Purpose

The first screen, Figure 3, informs the user of the demo's purpose. It lists the four academic disciplines that will be demonstrated and then describes six types of multimedia effects that are used. There is a button "Exit this Demo", which is also a hot word and allows the user to exit the demo to Microsoft Windows.

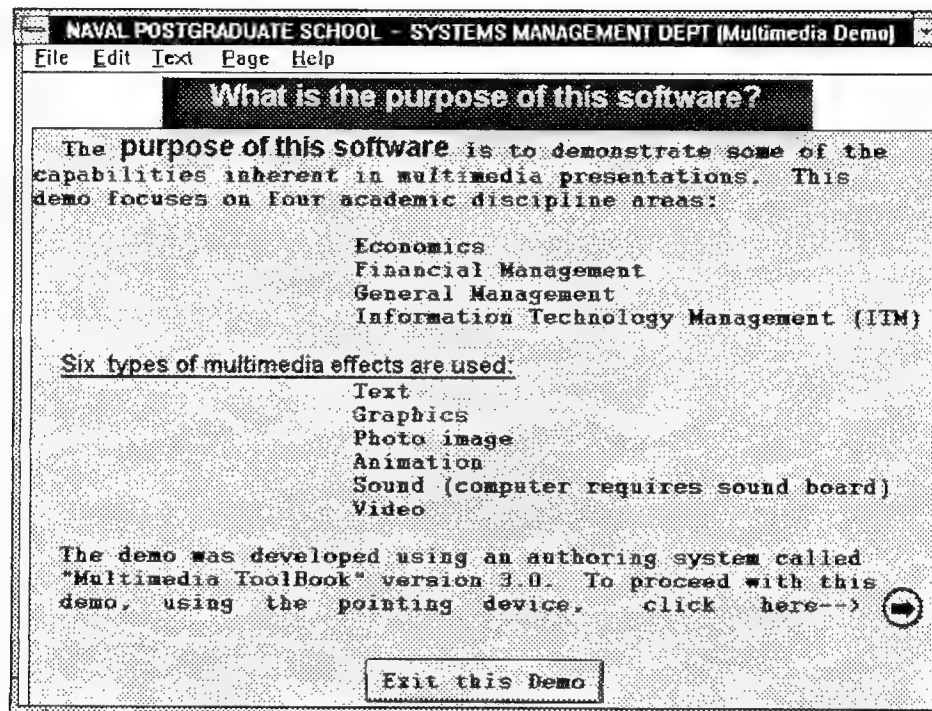

Figure 3. Purpose of this software

2. What is Multimedia?

Figure 4 describes the capabilities of multimedia. The screen has six hot words - one associated with each type of media. As the user points to each hot word, an example appears in the screen. For example, by pointing to the hot word associated with "Animation", the user will observe a white ball moving around the screen, then returning to its starting point. This screen demonstrates multimedia **Text**, **Graphics**, **Animation**, **Sound**, and **Video**.

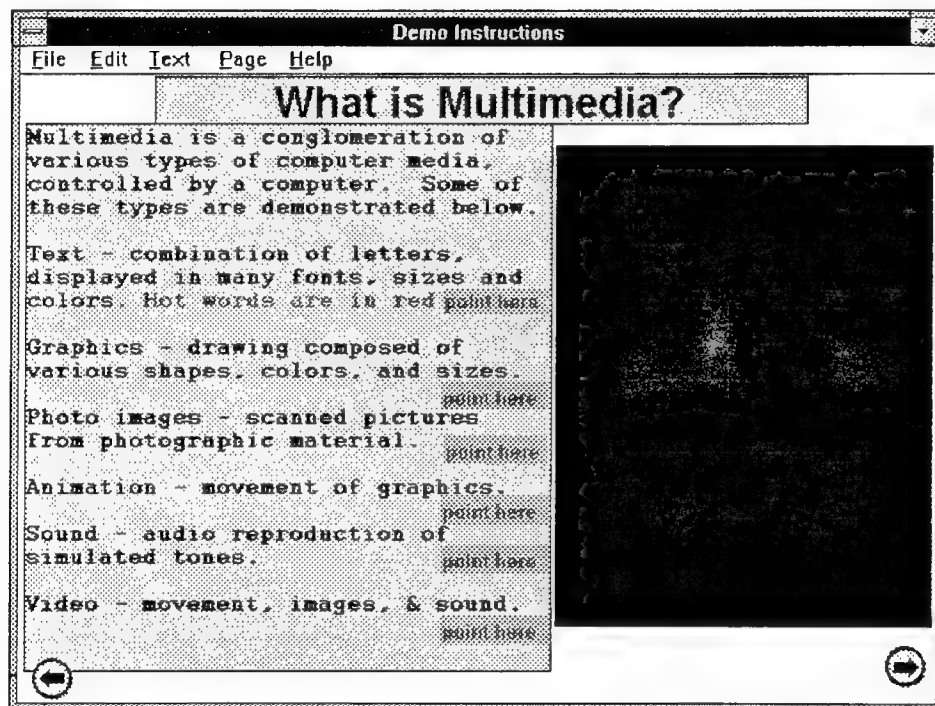

Figure 4. What is Multimedia?

3. Demo Instructions

The screen in Figure 5 provides the user with navigational instructions for operating the demo.

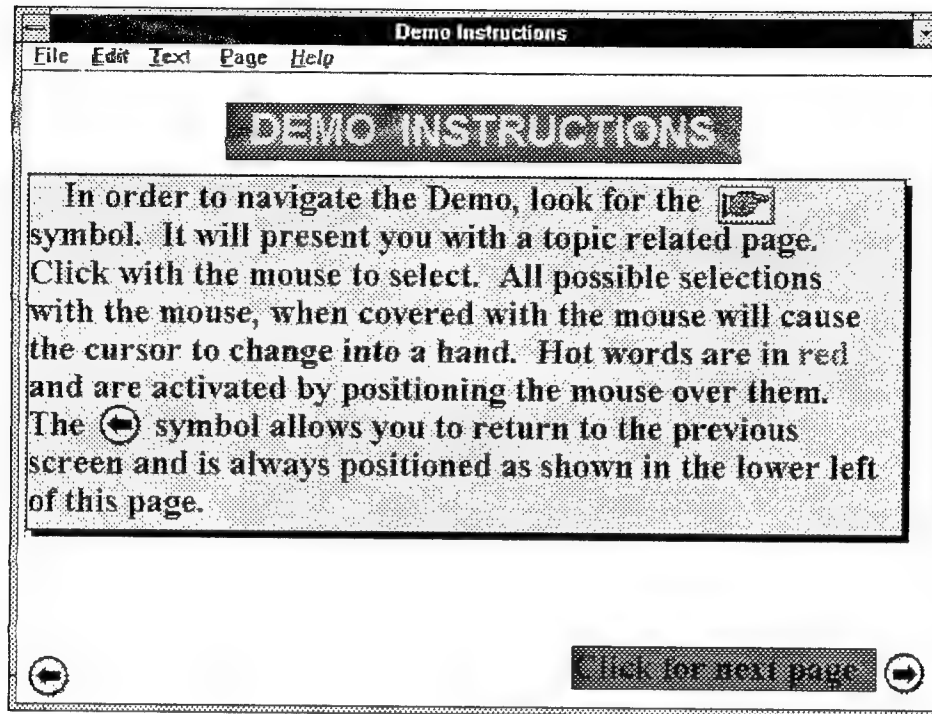

Figure 5. Instructions

4. Countdown Timer

This screen, Figure 6, simulates the countdown timer sometimes seen at the beginning of a film reel. It is another demonstration of animation and sound in action.

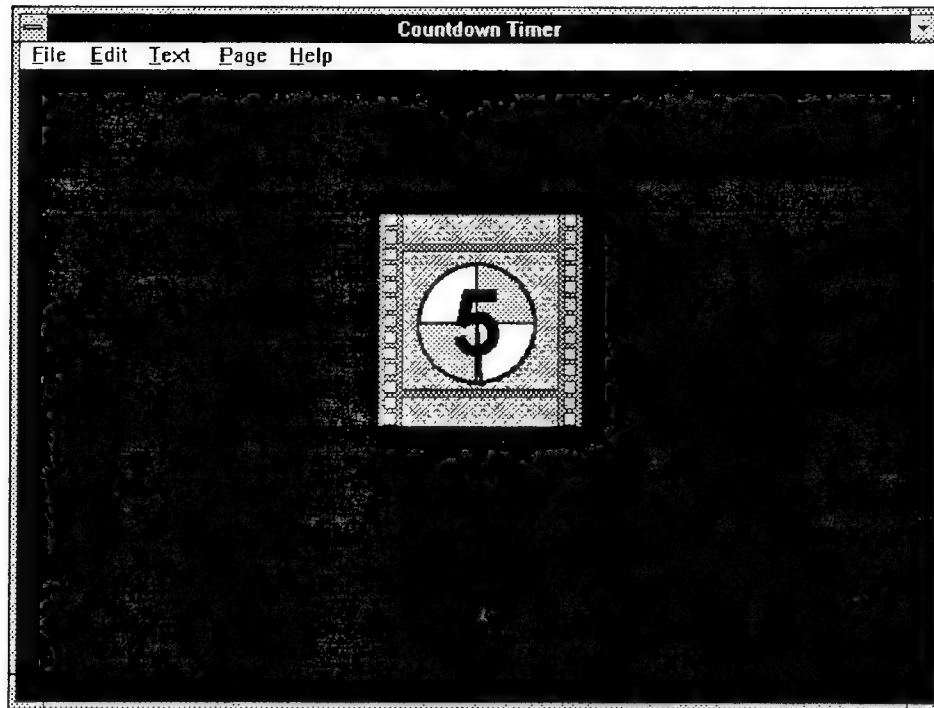

Figure 6. Countdown Screen

5. Main Menu

The **Main Menu** is shown in Figure 7 and consists of four major divisions: Economics, Financial Management, General Management, and ITM. Using the pointing device, the user clicks on the yellow pointing finger adjacent to the desired topic. This screen demonstrates animation in the upper right portion of the screen, where a disk appears to be spinning. It also demonstrates sound where a series of music files are played. There is a button "**Exit this Demo**", which is also a hot word and allows the user to exit the demo to Microsoft Windows.

B. ECONOMICS DEMO

1. Demand

This screen, Figure 8, introduces the concept of **Demand**, with hot word definitions for **Substitution Effect** and **Income Effect**. There are two buttons for selecting two demonstrations, one on the **Demand Curve**, and one on the **Elasticity of Demand**.

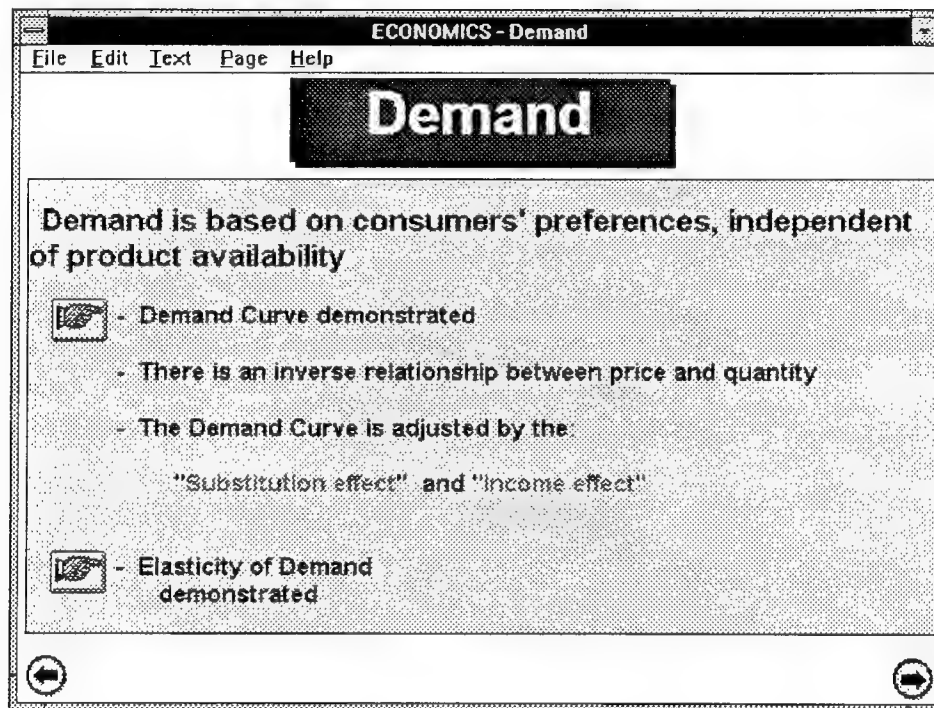

Figure 8. Demand Concept Defined

2. Demand Curve Demonstrated

This screen, Figure 9, gives the user an animated demonstration of **Demand Points**, the **Demand Line**, and shifting of the demand line. A demand point represents the quantity of an item that a customer demands from a supplier at a given price. A market survey will reveal all the quantities demanded at various prices. The "**Demand Points**" button plots the demand points, one-by-one. The "**Demand Line**" button connects the demand points as a line. After the "**Demand Line**" button is activated by clicking, a set of directional buttons appear for shifting the demand line. The user should note how shifting the line creates a new quantity demanded. There are also hot words for the Demand Points and Demand Line. A "**Reset**" button is provided to restore the screen for repeating the demonstration.

Figure 9. Demand Curve Demonstrated

3. Elasticity of Demand Demonstrated

The screen of Figure 10 provides an animation which explains the concept of Elasticity of demand. This concept describes the slope of the demand line for an item. As an example, unit elastic means that the demand line is such that dropping the item price one unit will increase the demand for the item by one unit. Inelastic means that changes in the item price will have a lesser effect on the quantity demanded. Using the buttons, the users can see **Unit Elastic** and **Inelastic** demonstrated. A "**Reset**" button is provided to restore the screen for repeating the demonstration.

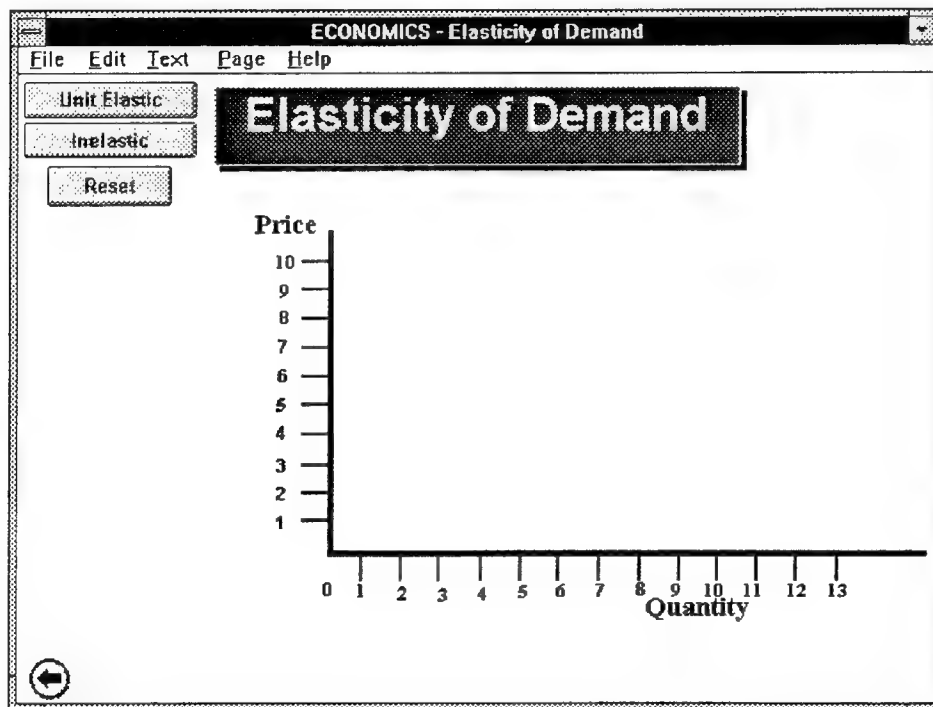

Figure 10. Elasticity of Demand Demonstrated

4. Price Restrictions

The screen in Figure 11 describes the concept of **Price Restrictions**. Hot words exists for **Price Floors**, **Effects of Inflation**, and **Effects of Taxes**. A button exists for a **Price Ceilings Demonstration** by clicking.

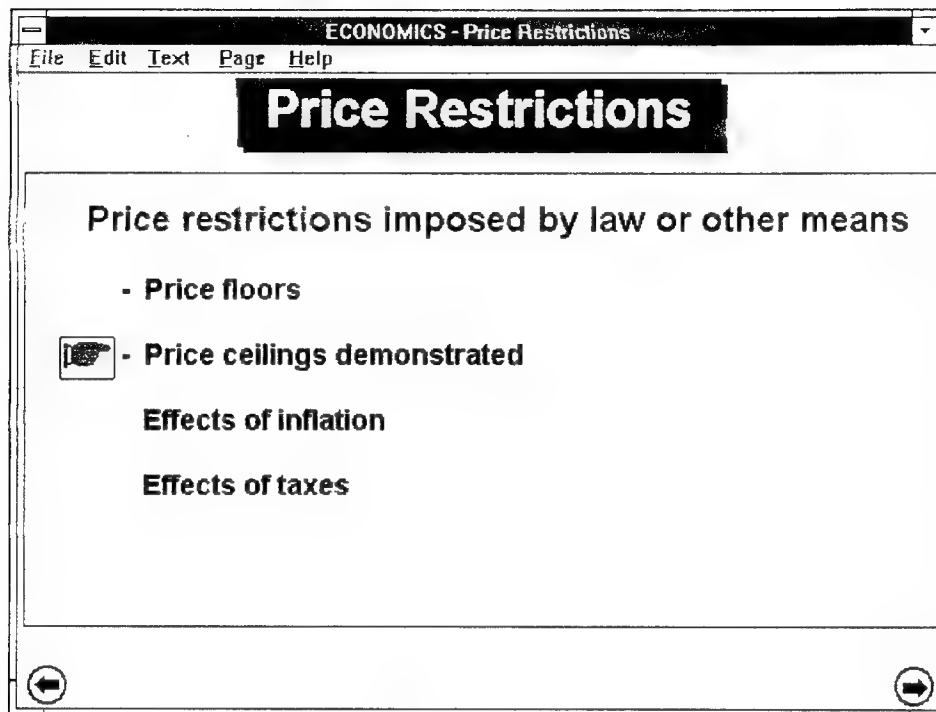

Figure 11. Price Restrictions

5. Price Ceilings Demonstrated

This screen in Figure 12 gives an animated demonstration of components involved with Price Ceilings, Price at equilibrium, price at the law imposed ceiling, and results of the price ceiling. When the user clicks on the "**P***" button, the screen will shade the price and quantity which results at the point the supply and demand line cross each other. When the user clicks on the "**P**" button, the screen will show a horizontal line representing the ceiling price imposed by law. When the user clicks on the "**PD**" button, the screen will shade a new area representing the new demand as a result of the price ceiling. Hot words are available for those buttons. A "**Reset**" button is provided to restore the screen for repeating the demonstration.

Figure 12. Price Ceilings Demonstrated

6. Supply

The Supply screen, Figure 13, defines the concept of Supply. There is a button for viewing a demonstration of the Supply Curve. There are two hot words: **Quantity Supplied** and **Supply Function**.

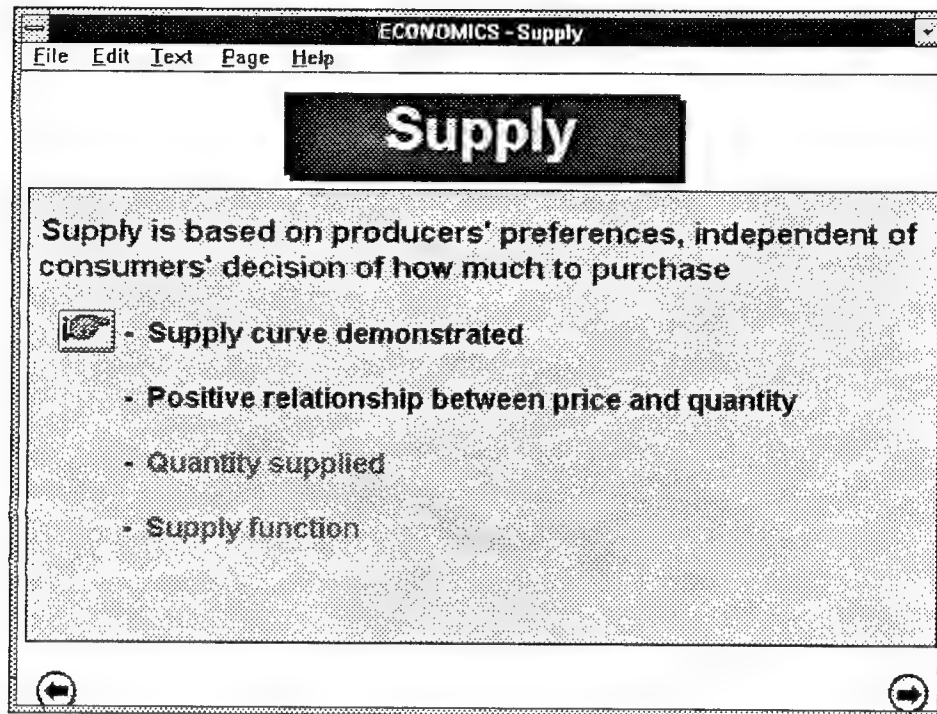

Figure 13. Supply

7. Supply Curve Demonstrated

This screen, Figure 14, gives the user an animated demonstration of Supply Points, the Supply Line, and shifting of the supply line. A supply point represents the quantity of an item that a producer is willing to sell at a given price. A market survey will reveal all the quantities supplied at various prices. The "Supply Points" button plots the supply points, one-by-one. The "Supply Line" button connects the supply points as a line. After the "Supply Line" button is activated by clicking, a set of directional buttons  appear for shifting the supply line. The user should note how shifting the line creates a new quantity supplied. There are also hot words for the Supply Points and Supply Line. A "Reset" button is provided to restore the screen for repeating the demonstration.

Figure 14. Supply Curve Demonstrated

8. Supply and Demand

The screen in Figure 15 describes the relationship between **Supply and Demand**. Two buttons are available for the user, by clicking, to see demonstrations of the **Principle of Scarcity** and the **Effects of Curve Shifts**. A button is provided to return the user to the "Main Menu".

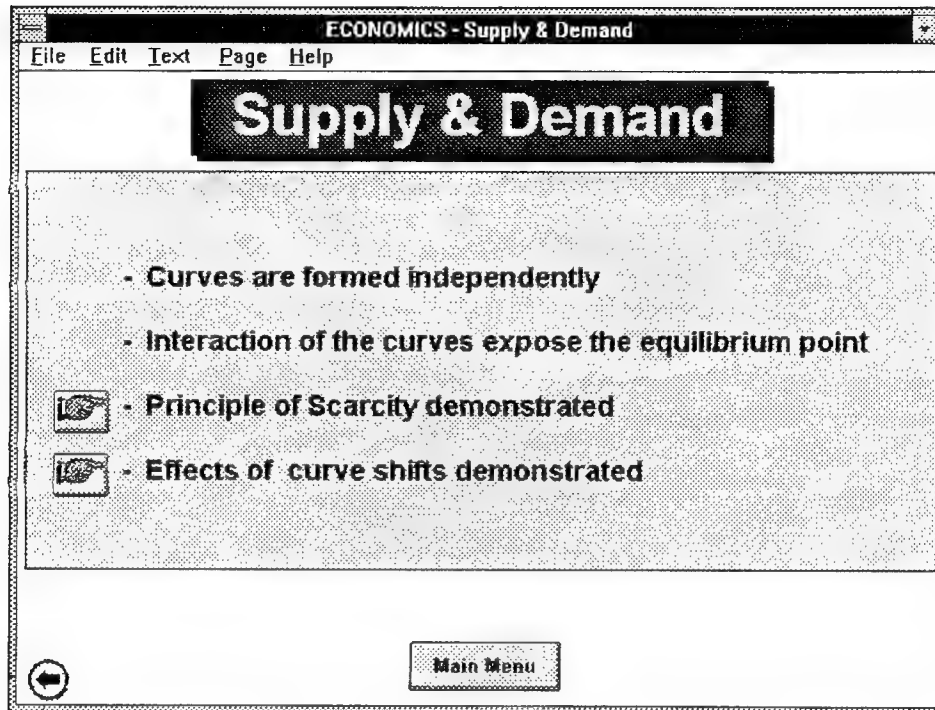

Figure 15. Supply and Demand

9. Principle of Scarcity Demonstrated

The screen in Figure 16 provides an animation describing the Principle of Scarcity. When "A scarce good" button is clicked, a supply line is drawn which crosses the existing demand line. This means that there exists few substitutes for that good, therefore buyers will continue to demand the good. When "A non-scarce Good" button is clicked, the screen will draw a supply line which will never cross the existing demand line. This means that buyers will not demand the good since there are many other substitutes available. Hot word are also provided for each of these buttons. A "Reset" button is provided to restore the screen for repeating the demonstration.

Figure 16. Principle of Scarcity Demonstrated

10. Effects of Curve Shifts Demonstrated

The screen in Figure 17 provides an animation which demonstrates the effects of interacting components to the shifts in Supply and Demand curves. The supply and demand line cross each other at the equilibrium point as shown. It is at this point that the buyers (demand curve) and the suppliers (supply line) will both agree to do business. The price and quantity at this point are indicated in the upper right part of the screen. Two directional buttons are provided for activating the shifts. As an example, if the "S->" button is clicked, the supply line will shift right and the new equilibrium point will be established as a display in the upper right screen. Hot words are provided for these directional buttons.

Figure 17. Effects of Curve Shifts Demonstrated

C. FINANCIAL MANAGEMENT DEMO

1. Background of the Accounting Cycle

This screen, as shown in Figure 18, lists information pertaining to the **Background of the Accounting Cycle**. Three buttons are provided which allow the user to navigate to the "Impact to the Financial Statements" (Figure 19) , "Ratio Analysis" (Figure 20), and "Events, transactions, and accounting demonstration" (Figure 21) screens by clicking with the pointing device.

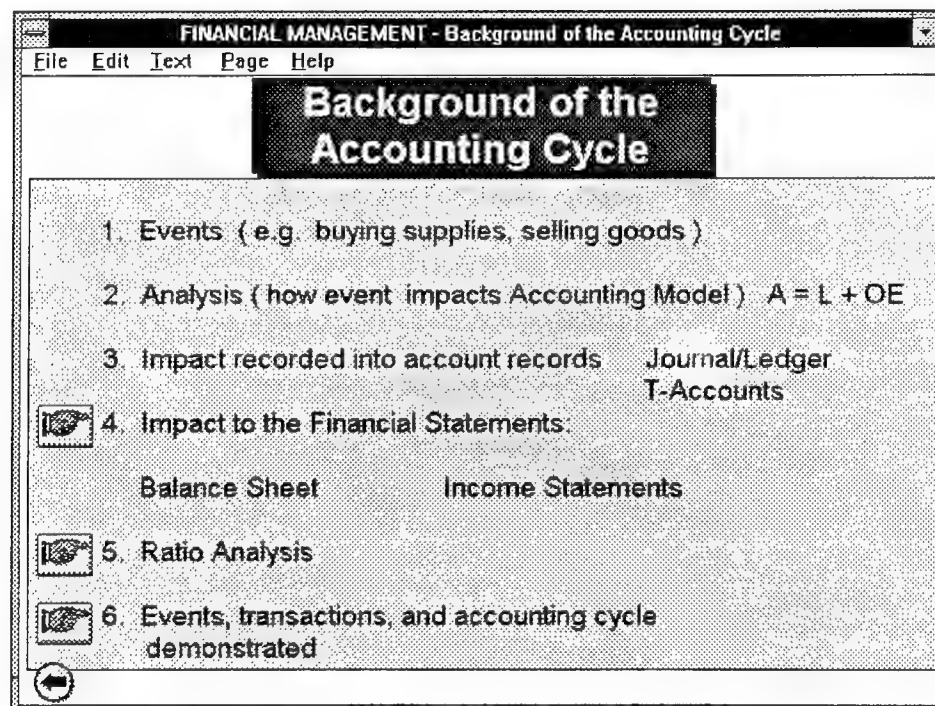

Figure 18. Background of Accounting Cycle

2. Impact to the Financial Statements

Figure 19 describes the **Impact to the Financial Statements** by supplying the user with an example event, and amount, with corresponding impact to the financial statements.

The screenshot shows a software window titled "FINANCIAL MANAGEMENT - Background of the Accounting Cycle". It contains a menu bar with "File", "Edit", "Text", "Page", and "Help". A black banner at the top reads: "If the event were: purchase inventory on account for \$200, the balance sheet would appear as below:". Below this, the "BALANCE SHEET" is displayed, divided into "ASSETS" and "LIABILITIES".

ASSETS		LIABILITIES	
Current:		Current:	
Cash		A/P	200
A/R		Wages /P	
INV	200	Bonds	
Total Current		Total	
Non-Current:		<u>STOCKHOLDERS EQUITY</u>	
Equip		Capital Stock	
Total Assets		Retained Earnings	
		Total	

Below the balance sheet is the "INCOME STATEMENT" section:

INCOME STATEMENT	
REVENUE:	
Sales	
EXPENSES	
Cost of Good Sold	
Wage Exp.	
Depreciation Exp.	
Total Expenses	
(NET LOSS)	

Figure 19. Impact to the Financial Statements

3. Ratio Analysis

This screen, shown in Figure 20, explains the Ratio Analysis concept as it impacts the financial statements. The phrases "**Ratio Analysis**" and "**Current Ratio**" are hot words with additional information.

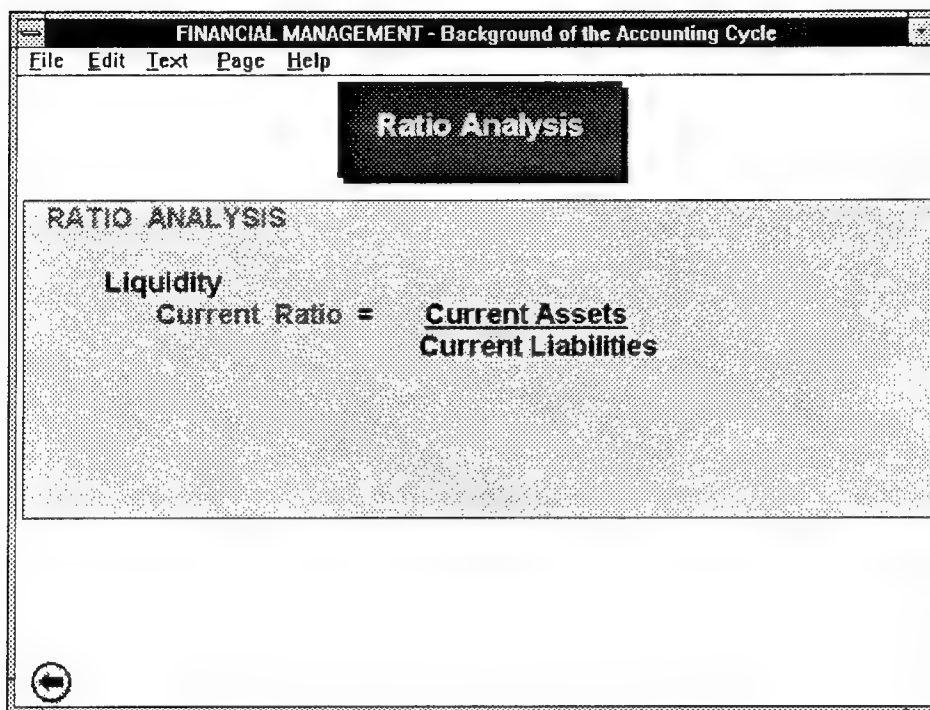

Figure 20. Ratio Analysis

4. Events, Transactions, and Accounting Cycle Instructions

This screen, as shown in Figure 21, provides the user with instructions for interacting with the **Events, Transaction and Accounting Cycle** demonstration.

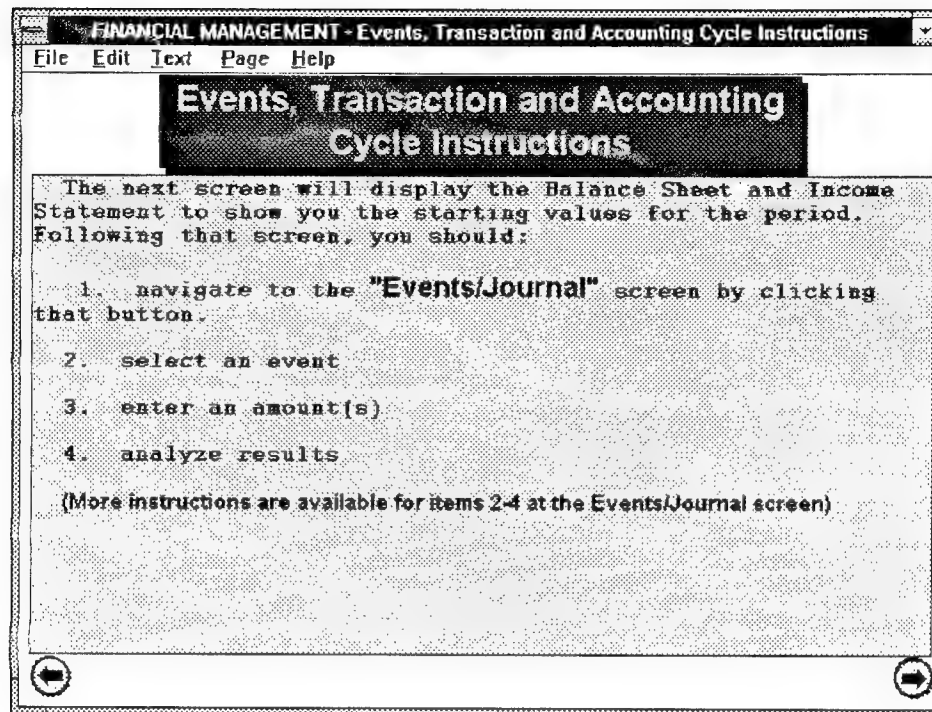

Figure 21. Events, Transactions, and Accounting Cycle Instructions

5. Events, Transactions, and Accounting Cycle Demonstration

The screen in Figure 22 incorporates interactive animation. The user is prompted by a field with yellow border and accompanying instructions to input data. First the user is to select an event from the upper left rectangular events object, whose border is highlighted in yellow. The selection can be made by clicking or using the arrow keys to highlight the selection, then pressing the enter key. The next input is the Amount field. Here the user inputs a numeric whole number value followed by the enter key. If the event requires two amounts, the next amount field will be highlighted for similar input. The "**Analysis results**" button is then highlighted for the user to click. This action will analyze the event with respect to the $A = L + SE$ model, indicating positive or negative impact and dollar amounts. The user can start with the first step to select another event. When satisfied, the user may proceed with the "**Apply transaction**" button by clicking it. This will take the event selected and associated amount(s), then apply them to the **Journal**, **T-Accounts**, and **Balance Sheet**. The demo will simulate the **Journal** book turning pages, then post entries to the Journal. The last five buttons will be highlighted for the user to select from. The "**To 'T' Accounts**" button navigates the user to the T-Accounts screen as shown in Figure 23. The "**To Balance Sheet**" button returns the user to the Balance Sheet screen as shown in Figure 24. The "**To background of Acct. Cycle**" button navigates the user to the Background of Accounting Cycle screen as shown in Figure 18. The "**To MAIN Menu**" button navigates the user to the **MAIN MENU** as shown in Figure 7. The "**Reset all entries**" button resets all event, journal, T-Account, and Balance Sheet entries to their starting values prior to user input, for a new round of simulation.

To Main Menu			

Figure 22. Events, Transactions and Accounting Cycle
Demonstration

6. T-Accounts

The screen in Figure 23 simulates the **T-Accounts** recordings. As the user inputs transactions in the **Events, Transactions, and Accounting Cycle Demonstration** screen, this screen will reflect that input. Additionally, the most recent input will be highlighted by a blinking red arrow above the affected accounts. As a transaction affects an account, a dotted line will be drawn in the account table with balances updated. As the account gets filled with data, the user may activate the scroll bars along the right side of the account to view more data.

The screenshot displays a software window titled "FINANCIAL MANAGEMENT - T-Accounts" with a menu bar (File, Edit, Text, Page, Help). The main area contains a 4x3 grid of T-accounts. Each T-account has a title, a balance box (BB), and a table with two columns and a scroll bar on the right. A red arrow points from the "WAGES PAYABLE" account to the "A/P" account.

CASH			A/R			INV		
BB	500		BB	300		BB	700	
EQUIP			WAGES PAYABLE			A/P		
BB	1000					BB		300
CAPITAL STOCK			RE			CGS		
BB		3000	BB		300			
SALES REV			WAGE EXP			DEPREC. EXP		

Navigation buttons at the bottom: To Events/Journal, To Balance Sheet, To background of acct. cycle, To MAIN Menu.

Figure 23. T-Accounts

7. Balance Sheet

The screen of Figure 24 provides the user with an update of the **Balance Sheet**. Any transactions input by the user in the **Events, Transactions, and Accounting Cycle Demonstration** will be reflected on this screen. After viewing the impact of selected events on the balance sheet, there are four buttons for the user to choose from. The "To Events/Journal" will navigate the user to the **Events, Transactions, and Accounting Cycle Demonstration** screen to repeat demonstration. The "To "T" Accounts" button will navigate the user to the **T-Accounts** screen as shown in Figure 23. The "To background of acct. cycle" button will navigate the user to the **Background of Accounting Cycle** screen as shown in Figure 18. The "To MAIN Menu" button will return the user to the **MAIN Menu** as shown in Figure 7.

D. GENERAL MANAGEMENT DEMO

1. Title Screen

This screen, shown in Figure 25, introduces the user to the General Management demo called "**Dealing with Conflict**."

Figure 25. Title Screen

2. Conflict Defined

The screen in Figure 26 gives the user a brief definition of the word: "**conflict**". There are four hot words within the definition of "**conflict**", they are "**conditions**", "**concerns**", "**people**", and "**appear**".

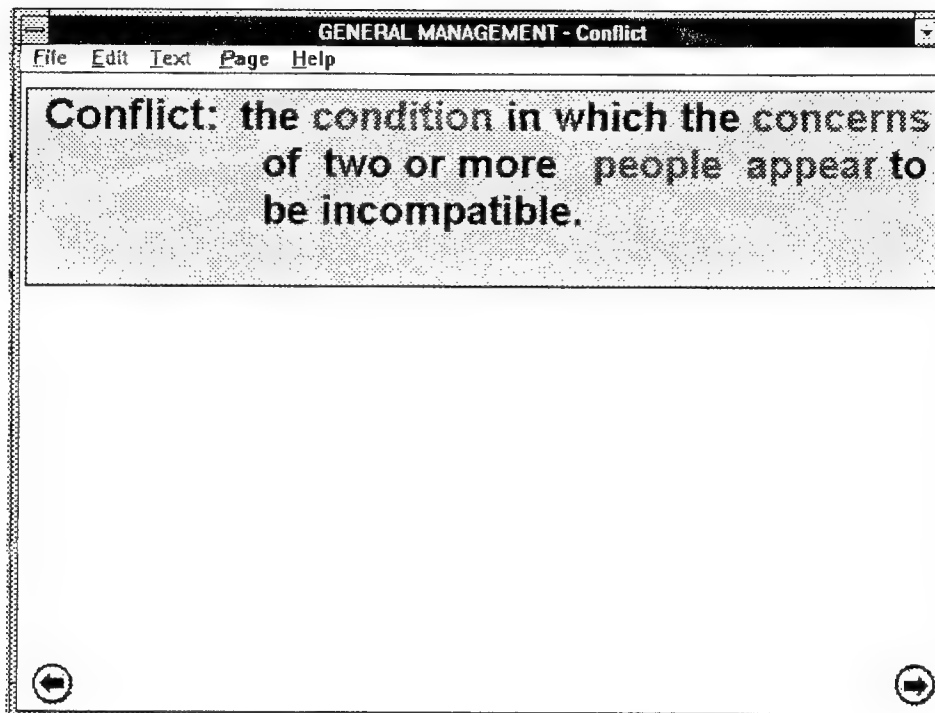

Figure 26. Conflict Defined

3. Dimensions of Conflict

The screen in Figure 27 gives the user information about the two dimensions of conflict. There are two hot words, "**assertiveness**" and "**cooperativeness**", which when activated, pop-out axis labels and change the appropriate arrow color to red.

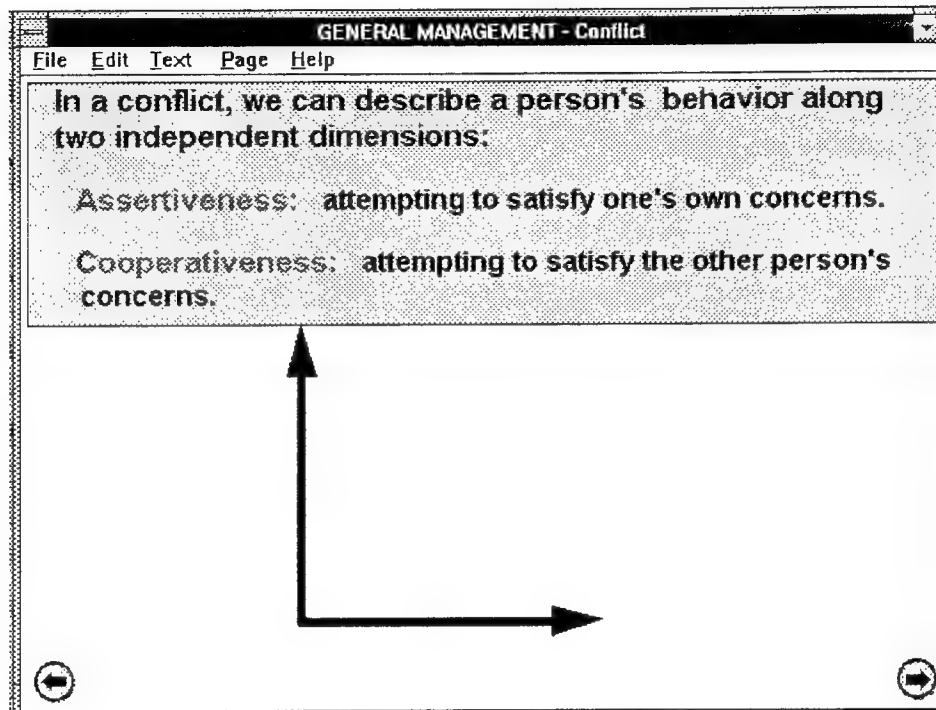

Figure 27. Dimensions of Conflict

4. Conflict Handling Modes

This screen, shown in Figure 28, presents the user with an animated depiction of the Conflict Handling Modes of conflict. Each of the rectangles labeled: "competing", "collaborating", "compromising", "avoiding", and "accommodating" are Conflict Handling Modes. Since they are hot words, when covered with the pointing device, they provide a brief definition. The squares to the right of each of these are also hot words. When they are covered with the pointing device, they provide example phrases which support each Conflict Handling Mode.

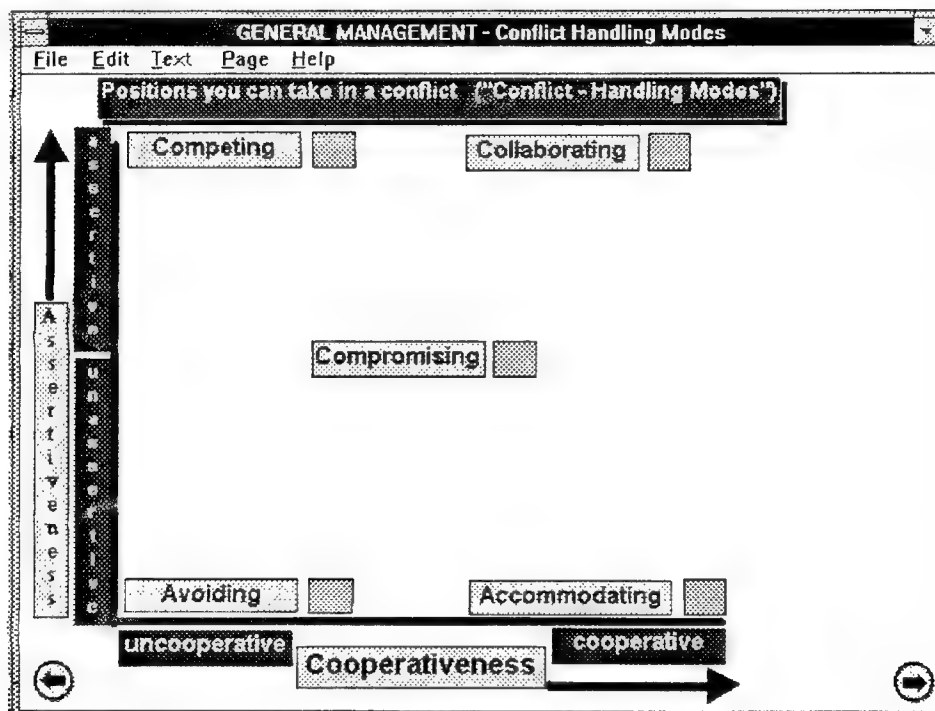

Figure 28. Conflict Handling Modes

5. Splitting Up the Pie

This screen, shown in Figure 29, provides an animation sequence controlled by a series of buttons which are activated by clicking. It provides the user with a phased presentation of portions of interests that are gained by two parties during conflict. The "**Lose/lose**" button displays a small dot representing a tiny fraction of interests gained. The "**Lose/win**" button displays three small circles: "**competing**", "**compromising**", and "**accommodating**", shaded with colors representing interests gained by each of the two parties. The "**Win/win**" button shows a large circle, "**collaborating**", split equally between the two parties. The "**Distributive**" button, when activated, draws a line along the "**competing**", "**compromising**" and "**accommodating**" circles. At this point, those Conflict Handling Modes become hot words to describe portions of interest claimed by each party. The "**Integrative**" button, when activated, draws a line along the "**avoiding**",

"compromising", and "collaborating" circles. The Conflict Handling Modes now contain new hot words.

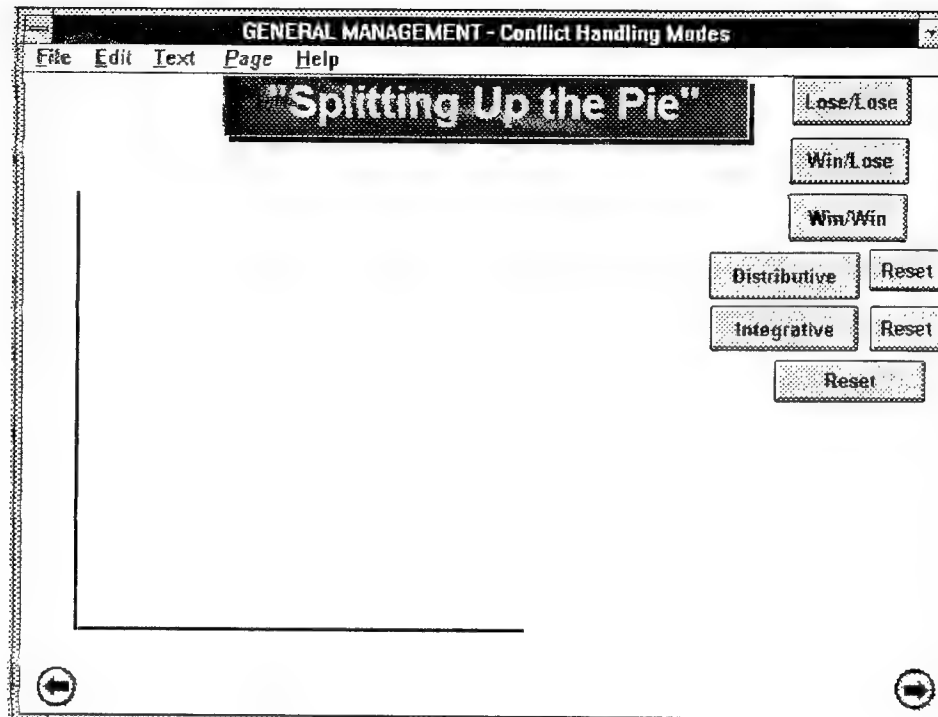

Figure 29. Splitting Up the Pie

6. Steps in Collaborating

This screen, as shown in Figure 30, provides the user with five steps involved in the Collaborating process. Initially, the user is presented with the first step. When the user clicks on the "next" button, the next step is shown until all steps are displayed.

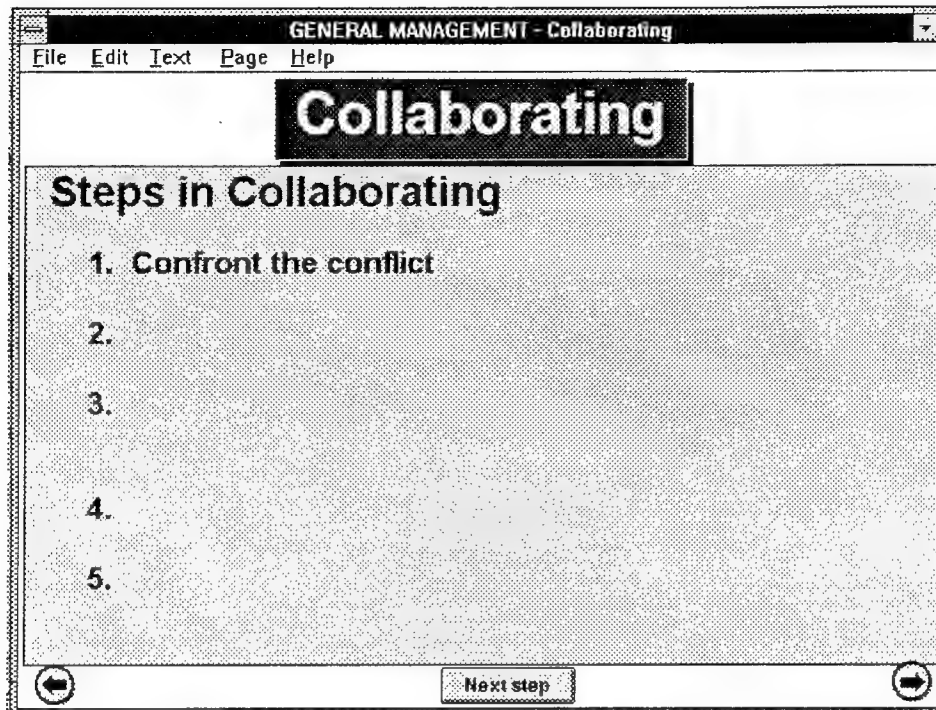

Figure 30. Steps in Collaborating

E. INFORMATION TECHNOLOGY MANAGEMENT DEMO

1. Computer Communications Architecture

This screen, shown in Figure 32, gives the user a brief overview of **Computer Communications Architecture** terminology. The user is presented with four navigational buttons. The first one allows the user to view a **Schematic Representation of the OSI Model**. The second button allows the user to gain more information about the **TCP/IP Protocol Suite**. The third button allows the user to learn more about **Basic Computer Communications**. The last one labeled "**Main Menu**", navigates the user to the MAIN Menu as shown in Figure 7.

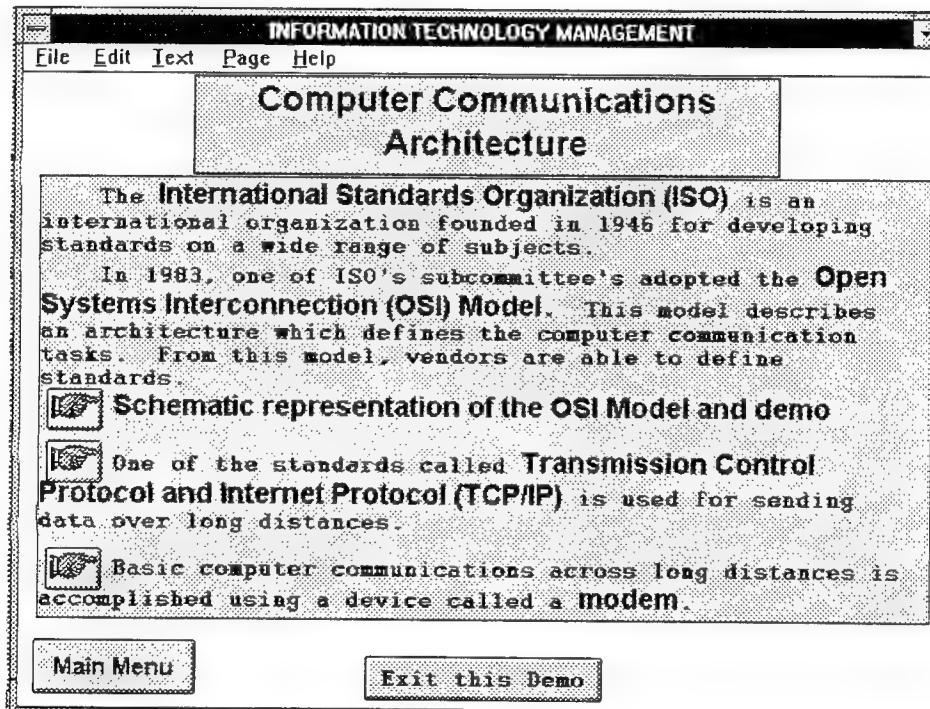

Figure 32. Computer Communications Architecture

2. Schematic Representation of the OSI Model and Demo

This screen is shown in Figure 33. It gives the user a **Schematic Representation of the OSI Model**. On the left stack of the model are hot words for each of the layers which provide descriptions of their purposes. The "**communications path**" object is a hot word which provides additional information about paths. The two "**SEND**" buttons when activated by clicking, demonstrate the logical path taken within the seven layer model for successful communication.

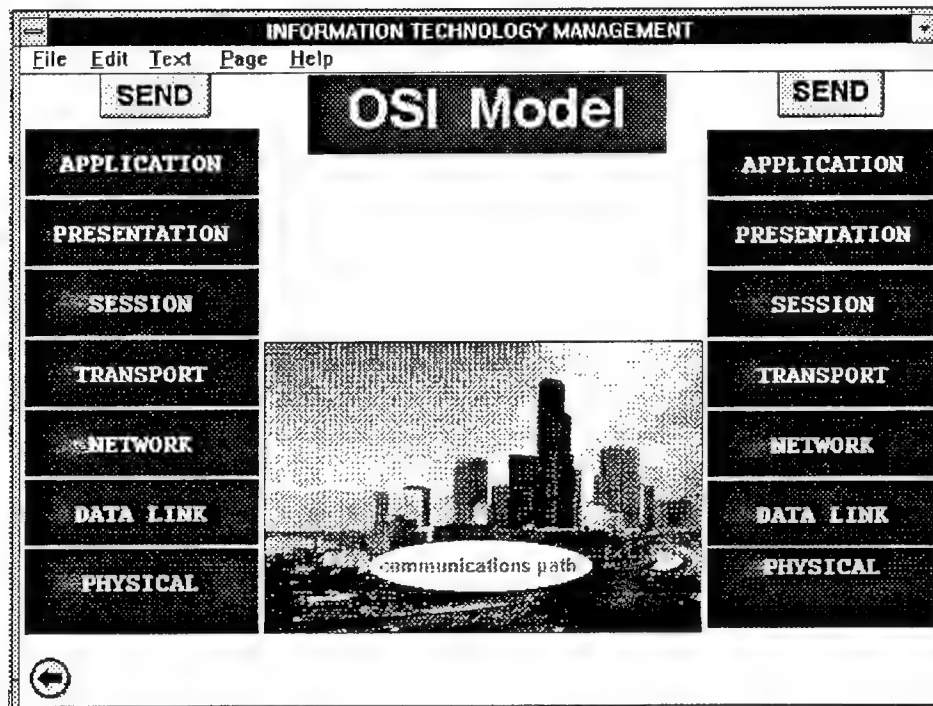

Figure 33. Schematic Representation of the OSI Model

3. The TCP/IP Protocol Suite

This screen, shown in Figure 34, provides information describing the principles and organization of the **TCP/IP Protocol Suite**. A navigational button is available for the user to see a **Diagram of Protocol Dependencies**.

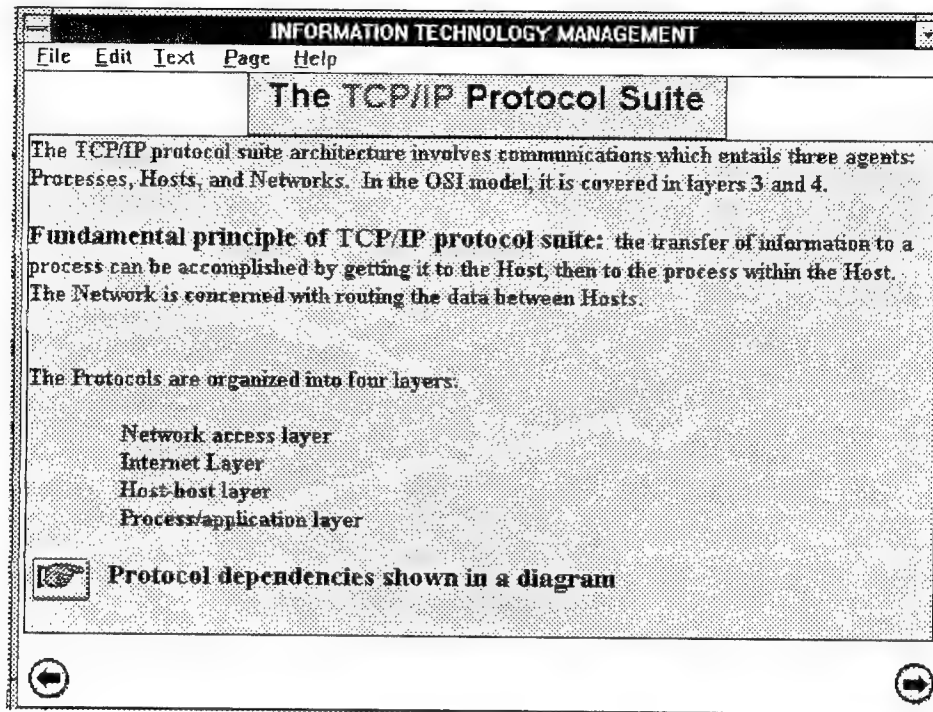

Figure 34. The TCP/IP Protocol Suite

4. Diagram of Protocol Dependencies

This screen, shown in Figure 35, provides the user with a diagram of **Protocol Dependencies**. Each of the Protocol acronyms are hot words which explain their meaning.

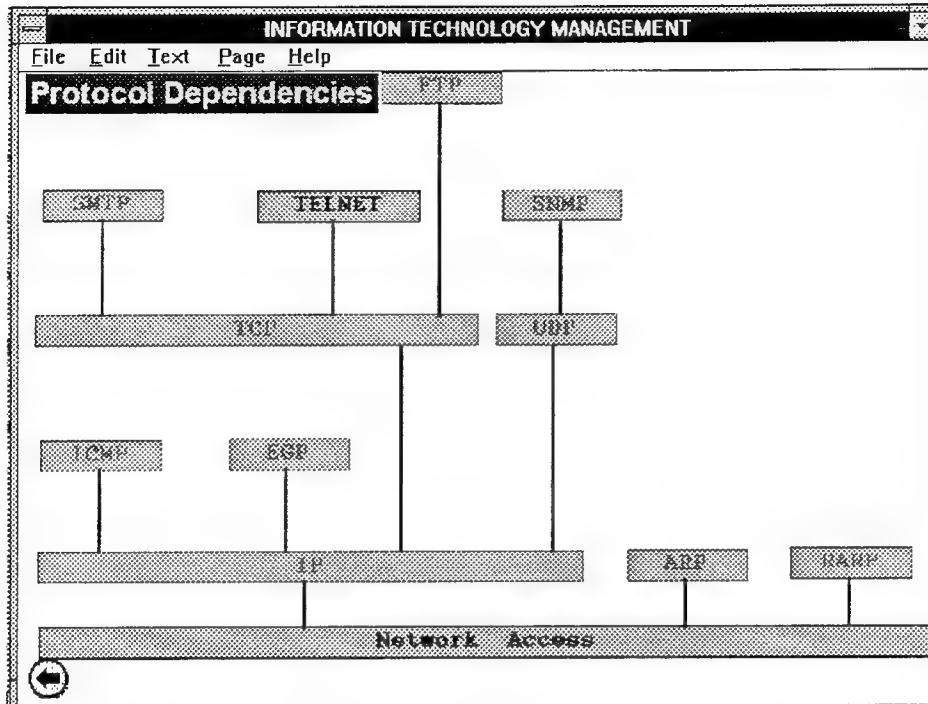

Figure 35. Diagram of Protocol Dependencies

5. Basic Computer Communications

This screen, shown in Figure 36, provides the user with some definitions of **Basic Computer Communications** terminology. The word "**modem**" is a hot word which explains its meaning. There is a navigational button which, when clicked, allows the user to view a **Demo of Computer Transmission over the Telephone Exchange System**.

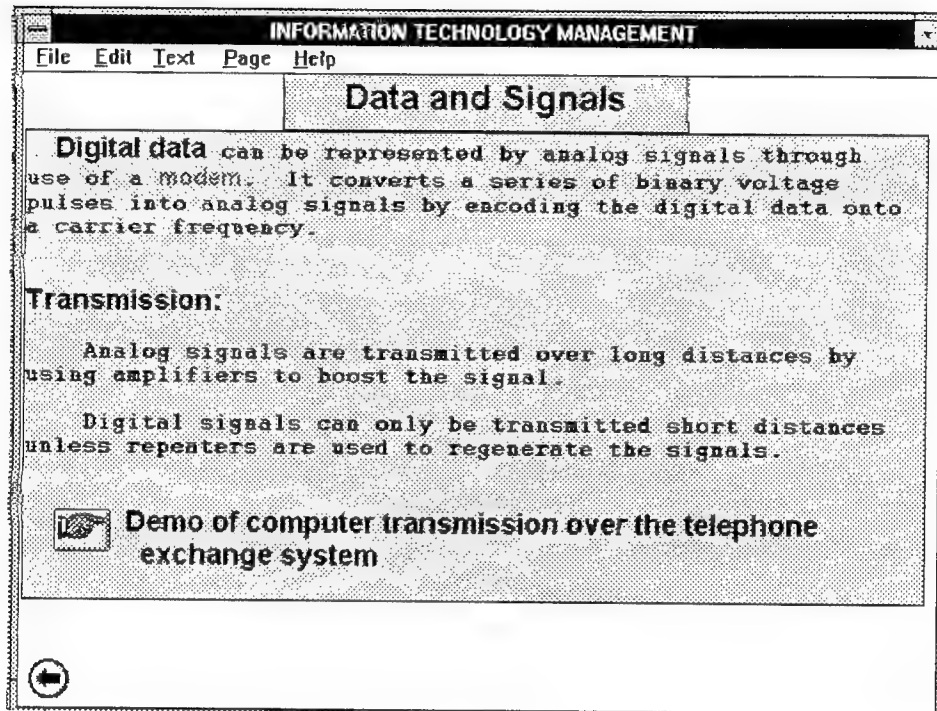

Figure 36. Basic Computer Communications

6. Demo of Computer Transmission Over the Telephone Exchange System

This screen, shown in Figure 37, provides the user with animation demonstrating the physical components of **Computer Transmission over the Telephone Exchange System**. There is a button labeled "SEND", when activated by clicking provides an animated demonstration of sending a computer signal from one computer to another. There is a button labeled "Exit this Demo" which allows the user to exit the demo to Microsoft Windows.
